

## Pumps for aquaculture

As a family-run company, **Calpeda** has been offering innovative and reliable pump technology for numerous aquafarming applications for decades.

From single-stage standard pumps, to multistage centrifugal pumps and a wide range of submersible pumps, **Calpeda** is a strong partner - not only in the field of aquaculture. Based on many years of experience, high-quality pumps are used both for fresh water and saltwater applications.

Well-known companies in the industry, such as aquaFUTURE e.K. with its main location in Kreuztal, Germany already rely on the quality of **Calpeda** pumps. aquaFUTURE e.K. looks back on more than 35 years of worldwide history in the field of aquaculture and is always looking for new, innovative concepts and solutions. **Calpeda** pumps are also used in the company's latest showcase project, the complete reconstruction and associated modernisation of the "Hasper Talsperre salmon centre".

Company owner and long-time industry expert Dietmar Firzlaff is sure to have found the right partner for future projects in **Calpeda**:

"Pumps play an increasingly important role in fish farming. With constantly rising electricity prices, choosing the right pump is an important part of our operating cost calculation. Through precise design and competent application of the highly efficient pump systems, **Calpeda** enables us to optimise all our operating costs over the entire product life cycle.

The young and qualified **Calpeda** team at the Alzenau site always advises us individually according to our ideas. Special enquiries are expressly welcome here. This is not a matter of course nowadays and gives us a high degree of flexibility".
